PRODUCT OVERVIEW

Your Complete Pharmacy Digital Platform

A connected system for your website, customer care, prescriptions, inventory, payments, and team operations — designed so every part of the pharmacy works together.

- **Patients**
  Self-service, refills, adherence & care
- **Caregivers**
  Family support with permission controls
- **Your Team**
  Operations, stock, CRM & fulfilment
- **Growth**
  Loyalty, campaigns & modern payments

Feature Guide for Pharmacy Partners

Prepared for client evaluation · Business-oriented overview

Confidential

INTRODUCTION

A digital pharmacy that works as one system

This platform is more than a website. It is a full operating system for modern pharmacy care — connecting how patients find you, how they manage medicines, how families support loved ones, and how your staff runs day-to-day operations.

Every major part is designed to talk to the others: a public refill request becomes a real workflow for your team; a prescription can drive stock movement when you dispense; loyalty, messaging, and reminders keep patients engaged after they leave the counter.

4	End-to-end	AI-assisted	M-Pesa ready
Connected portals	Care & commerce	Patient guidance	Local payments

Who this platform serves

Your customers

Browse medicines, request refills, place orders, pay securely, track adherence, earn loyalty rewards, and message the pharmacy — from phone or desktop.

Caregivers & family

Invite trusted helpers to view medications, confirm daily doses, request refills, and receive pickup alerts — only with permissions you control.

Pharmacy staff

Run inventory, prescriptions, refills, orders, CRM, campaigns, services, and escalations from one staff console built for daily pharmacy work.

What makes this different

Many pharmacy sites stop at marketing pages. This platform connects public discovery to real operational records — inventory, prescriptions, payments, adherence, and customer history — so digital activity becomes pharmacy work you can fulfil and track.

Inside this guide

01	Public website & first impressions	07	Orders, payments & M-Pesa
02	Customer portal — self-service care	08	CRM, messaging & growth
03	Medication adherence & reminders	09	AI assistant & symptom guidance
04	Caregiver platform	10	Security, roles & trust
05	Staff & admin operations	11	Capability overview
06	Medicines, inventory & stock	12	Why partners choose this platform

1. Public website & first impressions

How patients discover and engage with your pharmacy

Your public presence is professional, informative, and action-oriented. Visitors can learn about the pharmacy, explore medicines and services, get help from an AI assistant, and start refill or order requests — even before they create an account.

Core public pages

Home, About & Trust

Brand story, service highlights, opening hours, contact details, community presence, and clear paths into refills, services, and the health library.

Medicine catalogue

Live catalogue backed by your pharmacy inventory — not just static marketing content. Patients see availability, pricing, categories, strengths, forms, indications, and related options.

Health library

Readable health articles with related reading. Approved content can also power the pharmacy AI assistant, so answers stay aligned with your knowledge.

Services & booking

Present pharmacy services with benefits, eligibility, duration, and pricing — and accept online bookings that flow into staff workflows.

Delivery, FAQ & Contact

Clear delivery information, enquiry forms, FAQ support, careers applications, plus privacy and terms pages for professional trust.

Image medicine search

Patients can upload a photo of a medicine pack. AI reads the pack details and matches them to your public catalogue — helpful when names are hard to spell or remember.

Guest-friendly care

Patients who are not logged in can still request a refill or place an order with contact details. The experience gently encourages account creation for richer ongoing care — without blocking urgent needs.

2. Customer portal — self-service care

Logged-in experience for ongoing pharmacy relationships

Once registered, customers get a personal space for prescriptions, refills, orders, payments, medication reminders, caregivers, loyalty, messages, and preferences. This turns occasional visitors into managed, long-term patients.

What customers can do

- Complete onboarding with profile, contact, and preference details
- Request refills for pickup or delivery with preferred timing
- Pay for priced refills and orders via M-Pesa
- Receive and manage dose reminders
- Earn and redeem loyalty points and coupons
- Set email, SMS, WhatsApp, and marketing preferences
- View active prescriptions, dosage, and refills remaining
- Place and track orders from the portal
- Track medication adherence and dose history
- Invite and manage caregivers with permissions
- Message the pharmacy and receive notifications
- Share feedback, reviews, and suggestions

Refill journey (customer view)

1. Submit a refill from the portal (or guest form)
2. Pharmacy reviews and approves the request
3. Medicine is prepared for pickup or delivery
4. Customer is notified when ready
5. Payment is completed where required (including M-Pesa)
6. Collection or delivery closes the loop

Refill statuses move clearly through the pharmacy: submitted → under review → approved → preparing → ready for pickup → collected (or cancelled). Requests can originate from the website, portal, AI assistant, phone, WhatsApp, or staff entry.

3. Medication adherence & reminders

Helping patients stay on treatment — day after day

Adherence is one of the platform's standout capabilities. Prescriptions can carry structured dose schedules. The system generates daily dose reminders, records whether doses were taken, missed, or late, and can escalate when patients fall behind.

Smart schedules

Turn dosage instructions into structured times and quantities. Generate today's doses and upcoming reminders automatically.

Dose logging

Record taken, missed, late, or open doses — by the patient or an authorised caregiver — with timestamps and notes.

Progress & streaks

Show adherence rates, taken/missed counts, and current streaks so patients and staff can see progress clearly.

Progressive escalation · commercial value

Reminders are not a single ping and forget. Multi-step escalation keeps follow-up attentive when someone misses medication. Better adherence improves outcomes and strengthens refill continuity — turning your pharmacy into a care partner, not only a retailer.

4. Caregiver platform

Family support with clear privacy boundaries

Caring for an elderly parent, a child, or someone on complex medication is hard. This platform gives caregivers a dedicated space — not just a shared login — with explicit permissions and strong privacy controls.

Invite & permission model

Customers invite caregivers by name, email, or phone. Secure invitations expire. Permissions separately control refill requests, pickup alerts, and dose logging.

Daily caregiver tools

Today's dose checklist, patient medication views, refill requests (when allowed), adherence summaries, pickup alerts, and reminders for linked patients only.

Caregiver journey

1. Patient invites a trusted caregiver from the portal
2. Caregiver accepts the secure invitation
3. Caregiver sees only authorised patients and permissions
4. Daily: review doses, confirm taken, request refills if allowed
5. Receive pickup and reminder notifications when enabled

Privacy by design

Caregivers cannot browse other customers, loyalty programmes, campaigns, or admin data. Even AI assistance for caregivers is limited to authorised patient information — protecting clinical and commercial confidentiality.

5. Staff & admin operations

The pharmacy control centre

Your team gets a full operations console: customers, medicines, inventory, prescriptions, refills, orders, payments, messaging, campaigns, services, and escalations. Role-aware access keeps staff, pharmacists, and managers in the right workspace.

Operations at a glance

- Dashboard with inventory health, low stock, expiry, and reorder signals
- Prescription creation, editing, and dispatch against stock
- Order fulfilment for counter, portal, website, and refill sources
- Messaging inbox across email, SMS, WhatsApp, and portal
- Loyalty programme administration and coupon control
- Symptom-triage escalations for staff follow-up
- Customer CRM with profiles, notes, timelines, and full history
- Refill queue management through the full lifecycle
- Payment tracking including M-Pesa and waived orders
- Campaigns and customer segments for targeted outreach
- Pharmacy services catalogue and booking management
- Location, hours, and pharmacy settings management

Staff fulfilment journey

1. Request arrives (order, refill, booking, or enquiry)
2. Staff opens customer and clinical context in CRM
3. Review prescription / medicine and prepare stock
4. Record stock movement and confirm payment or waiver
5. Dispatch / hand over / arrange delivery
6. Customer is notified; timeline and records update

6. Medicines, inventory & stock control

Clinical accuracy meets commercial reality

A defining strength of this platform is how medicines are modelled. Clinical product definitions are separated from pharmacy-specific stock and pricing — so you keep clean medicine data while managing real shelves, lots, and costs.

Medicine master record

Name, generic, brand, strength, form, route, manufacturer, barcode, indications, dosage, side effects, contraindications, storage, controlled-drug flags, paediatric notes, and more.

Pharmacy inventory record

Your price, purchase cost, stock level, low-stock threshold, supplier, shelf location, OTC/Rx flags, public listing, promotions, and POS readiness.

Fast ways to add medicines

Shared library

Search an existing medicine library by name, generic, brand, or barcode and add to your stock.

Barcode scan

Camera or hardware scanner lookup, with manual entry fallback and AI-assisted import if needed.

Bulk & AI import

CSV/Excel import with column mapping, or AI-assisted pack extraction with human review before save.

Inventory operations you can trust

- Lot-level tracking with batch numbers and expiry dates
- First-expiry-first-out (FEFO) lot deduction for pharmaceuticals
- Validation before save — duplicates, barcode clashes, controlled-drug rules
- Full stock movement history (receive, sale, adjust, dispatch, return, write-off)
- Low-stock, out-of-stock, reorder, and expiry monitoring
- Progressive data enrichment: start lean, complete records over time

Important operating rule

Creating a prescription or refill does not automatically reduce stock. Stock only moves when you dispatch or fulfil. That separation protects inventory accuracy and mirrors how real pharmacies work.

7. Orders, payments & M-Pesa

Commerce that fits local pharmacy practice

Orders can come from the counter, customer portal, website, or refill workflows. The platform tracks pricing, discounts, coupons, fulfilment mode, payment state, and dispatch separately — so money and medicine never get confused.

Order flexibility

Support immediate fulfilment, reserve-for-later, or delivery. Attach staff notes, clinical reasons, dispenser notes, line items, and waivers with clear records.

M-Pesa mobile money

Customer-friendly STK Push payments with status tracking, retries, and failure reasons. Also supports cash, card, and other payment records alongside mobile money.

Payment vs fulfilment

Paid means payment is received (or stock reserved). Fulfilled means the physical handoff or dispatch has happened. Waived orders store reason and scope (one-time, recurring to a date, or permanent) so free or subsidised care never looks like normal revenue.

Pharmacy services & bookings

Beyond product sales, you can publish bookable pharmacy services — vaccinations, consultations, screenings, and more — with pricing, eligibility, and online booking. Bookings flow to staff, and paid services can use the same payment infrastructure.

8. CRM, messaging & growth

Know your patients. Reach them at the right moment.

Customer 360°

One place for profile, prescriptions, refills, orders, notes, messages, feedback, caregivers, and adherence — with a chronological timeline of interactions.

Unified inbox

Conversations across email, SMS, WhatsApp, portal, AI, and system channels with templates, assignment, and delivery tracking.

Notifications everywhere

Email, SMS, WhatsApp, push, and in-app alerts for refills, pickups, reminders, bookings, and operational events.

Campaigns & segments

Build customer segments with rules, then launch multi-channel campaigns (email, SMS, WhatsApp). Track sent, delivered, opened, clicked, and replied — so marketing is measurable.

Loyalty & coupons

Bronze → Platinum tiers, points earning/redemption, referrals, bonuses, and coupons (percent, fixed, or points-based) with global and per-customer limits.

Feedback & enquiries

Capture reviews, suggestions, complaints, and satisfaction ratings. Manage general, availability, delivery, contact, and careers enquiries with status, assignment, and staff notes — so nothing important disappears in a shared inbox.

9. AI pharmacy assistant & symptom guidance

Helpful automation with clinical safety boundaries

AI is built in as a pharmacy-safe assistant — not a free-form chatbot that invents advice. It works with your real catalogue and approved knowledge, and it knows when to stop and escalate to a human pharmacist.

What the AI can do

Patient-facing assistance

Search publicly listed medicines for availability and price, open medicine details, retrieve approved knowledge articles, explain services, and guide people to refill, order, or contact pages.

What it will not do

It is instructed not to diagnose, prescribe, change prescriptions, make clinical decisions, interpret lab results, or reveal internal stock counts, suppliers, shelf locations, purchase prices, or other customers' data.

"How do you feel?" symptom journeys

A guided symptom experience helps visitors describe how they feel (for example headache, stomach, cold/flu, skin, allergy). Sessions can include structured answers, AI conversation, optional images, summaries, red-flag detection, and escalation into staff CRM and enquiry workflows. Follow-up check-ins (better / same / worse) turn a one-off chat into a monitored care journey.

Staff stay in control

You maintain an AI knowledge base with approval states. Only approved content is meant for the customer-facing assistant. Escalated symptom sessions land with your team for acknowledgement, reply, and resolution.

10. Security, roles & trust

Built for sensitive health and commercial data

Identity & access

Registration, login, email verification, password reset, Google sign-in, and secure session handling so only the right people get in.

Role-based workspaces

Distinct experiences for customers, caregivers, pharmacists, staff, and managers — with protected portal, caregiver, and admin areas.

Data scoping

Customers only see their data. Caregivers only see linked patients with granted permissions. Public AI only sees public catalogue information.

Sensitive features such as AI chat and image medicine search are rate-limited to protect service quality. Activity can be traced for operational accountability — who did what, when, and on which record.

Connected services (plain language)

Built on a modern, secure web foundation with reliable cloud database storage, file and image storage, push notifications, AI assistance, Google sign-in, M-Pesa mobile payments, and delivery-provider readiness. Automated background jobs help with inventory health checks, loyalty processing, and reminder delivery.

11. Capability overview

At-a-glance coverage for decision makers

Capability area	Business readiness
Public pharmacy website & trust pages	Strong
Live medicine catalogue & education	Strong
Guest refills & guest orders	Ready
Customer self-service portal	Strong
Caregiver portal & permissions	Strong
Prescriptions, refills & dispatch	Strong
Medication adherence & dose reminders	Strong
Inventory, lots & FEFO stock control	Strong
Multi-path medicine onboarding	Strong
Orders & fulfilment workflows	Strong
M-Pesa / mobile money payments	Ready*
Loyalty, coupons & referrals	Strong
CRM, inbox & multi-channel messaging	Strong
Campaigns & customer segmentation	Ready
Pharmacy services & online booking	Strong
AI assistant with safety boundaries	Strong
Symptom guidance with staff escalation	Strong
Push notifications	Ready*
Delivery integration foundation	Ready
Multi-pharmacy SaaS tenancy	Not in scope yet

* Items marked Ready require live credentials and environment verification (payment provider, push service, messaging providers) before go-live.

End-to-end value in one picture

Discover → browse medicines & services → Ask / search → request refill or order → Pay → pharmacy prepares stock → Notify → collect or deliver → Adhere & refill with ongoing reminders and loyalty.

One connected system

Public discovery, patient self-service, caregiver support, and staff operations share the same underlying records — so digital demand becomes work your team can fulfil, measure, and improve.

12. Why partners choose this platform

Summary for decision makers

This is a complete digital pharmacy ecosystem — not a brochure site with a contact form. It already covers the journeys that matter to modern pharmacies:

For patients & families

Easier discovery, smarter medicine search, self-service refills and orders, secure payments, dose support, caregiver help, and continuous communication with the pharmacy they trust.

For the pharmacy business

One operational spine for inventory, prescriptions, fulfilment, CRM, marketing, services, and AI — reducing fragmented tools and bringing digital demand into real workflows.

Standout strengths

1. Medicine master vs inventory separation — clean clinical data and accurate stock
2. Lot tracking with FEFO deduction — appropriate for pharmaceutical inventory
3. Prescription ≠ dispatch — clinical authority and stock movement stay distinct
4. Structured adherence with caregiver permissions — real care continuity
5. AI with pharmacy-safe boundaries — helpful without overreaching clinically
6. Symptom journeys that escalate to staff — digital triage that lands in operations
7. CRM connectivity — public actions become tracked customer history
8. Multiple medicine acquisition paths — library, barcode, AI, CSV, manual
9. M-Pesa-ready commerce — payments aligned with local customer behaviour
10. Loyalty and campaigns — tools to grow repeat custom, not only one-off sales

Recommended next step

The highest-value work after evaluation is not adding more pages — it is hardening the workflows you care about most, verifying payments and notifications in your environment, aligning legal and business rules with live capabilities, and launching with a focused go-live checklist for staff and patients.

Bottom line

A connected foundation for public discovery, customer self-service, caregiver support, pharmacy operations, inventory, prescriptions, refills, adherence, payments, CRM, communications, loyalty, services, and AI — ready to be tailored to your pharmacy.

Thank you for reviewing this guide. We are ready to walk through a live demonstration mapped to your pharmacy's priorities.
